Description

The AL994x devices are high-performance, 4-channel digital isolators with 5000 V_{RMS} (WSOP-16 packages), 3750 V_{RMS} (SOP-16, QSOP-16 package), isolation ratings per UL 1577. These devices are also to be certified by VDE, UL, CSA, CQC and CB.

The AL994x devices provide high reliability and high performance at low power consumption while isolating digital input and output. Each isolation signal channel is separated by a double capacitive silicon dioxide insulation barrier. The AL9940 device has four channels in the same direction while the AL9941 device has three channels in the forward direction and one channel in opposite direction. The AL9942 device has two channels in the forward direction and two channels in opposite direction. In the event of input power or signal loss, the default output is low for devices with suffix F and high for devices without suffix F.

The common mode transient immunity (CMTI) and electromagnetic compatibility of the AL994x devices have been significantly enhanced through innovative circuit design and optimized structure.

AL994x family is available in SOP-16, QSOP-16, WSOP-16 package, and is characterized from -40°C to +125°C.

Detailed Description

Overview

The AL994x family design an ON-OFF keying (OOK) modulation circuit to transmit the digital data by the isolation barrier. The transmitter sends a high frequency carrier across the barrier to represent one digital state and sends no signal to represent the other digital state. The receiver demodulates the signal after advanced signal conditioning and produces the output through a buffer stage, which builds in an H-CMTI (High-performance Common-mode transient immunity) circuit to protect the normal signal transmission and minimize the radiated emissions due to the high-frequency carrier and IO buffer switching. The block diagram of a digital capacitive isolator shows a functional block diagram of a typical channel in Figure 12.

Device Functional Modes

The below table lists the functional modes for the AL994x devices.

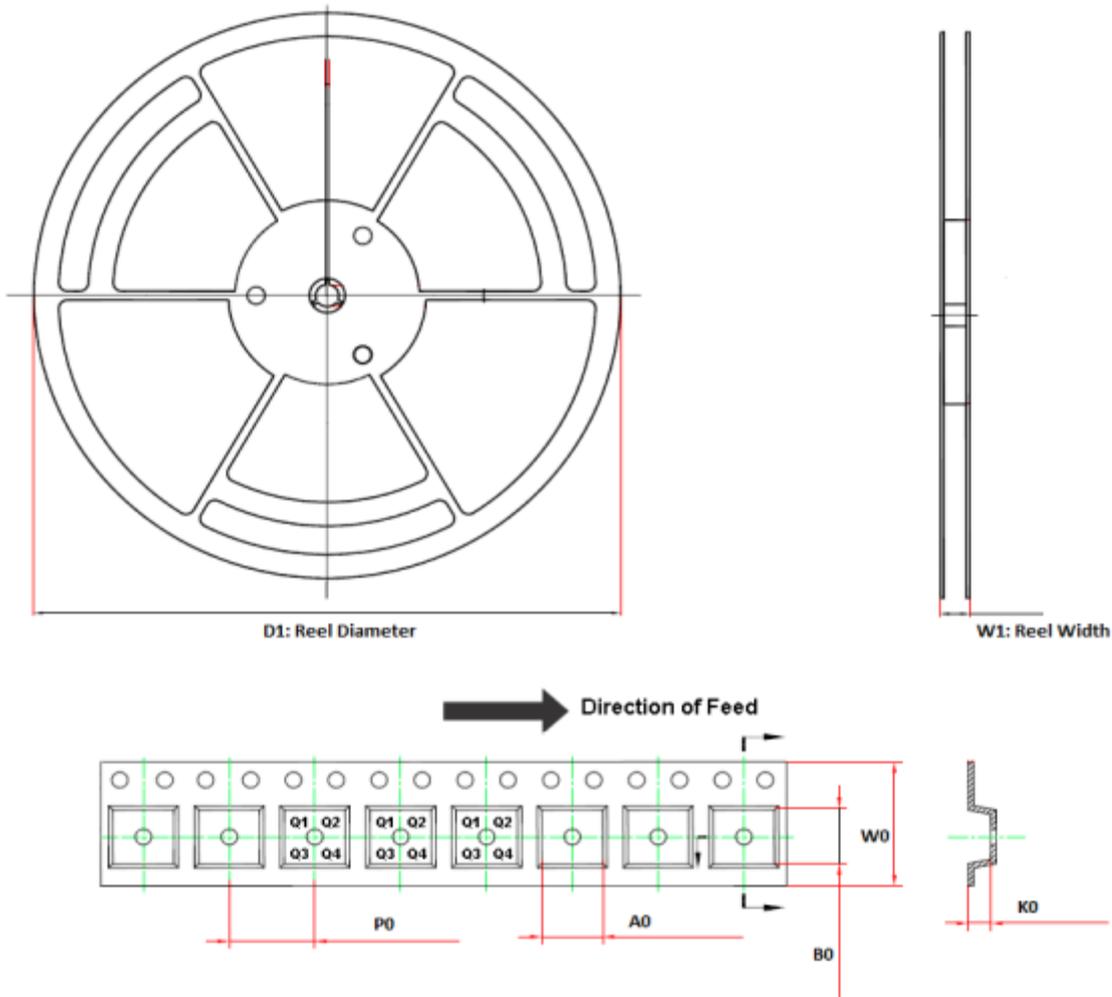

VCC _i	VCC _o	Input (IN1, IN2)	Output (OUT1, OUT2)	Comments
PU	PU	H	H	Normal Operation: A channel output assumes the logic state of the input.
		L	L	
		Open	Default	Default mode: When IN _x is open, the corresponding channel output goes to the default logic state. The default is High for AL994x and Low for AL994xF
PD	PU	X	Default	Default mode: When VCC _i is unpowered, the default is High for AL994x and Low for AL994xF When VCC _i transitions from unpowered to powered-up, a channel output assumes the logic state of the input. When VCC _i transitions from powered-up to unpowered, channel output assumes the selected default state.

X	PD	X	Undetermined	When VCC _O is unpowered, a channel output is undetermined. When VCC _O transitions from unpowered to powered-up, a channel output assumes the logic state of the input
---	----	---	--------------	---

(1) VCC_I = Input-side V_{CCA}; VCC_O = Output-side V_{CCB}; PU = Powered up (V_{CC} ≥ 2.25 V); PD = Powered down (V_{CC} ≤ 1.7 V); X = Irrelevant; H = High level; L = Low level

(2) The outputs are in the undetermined state when 1.7 V < VCC_I, VCC_O < 2.25 V.
